

Executive Summary: Canadian Secondary Debt Market Analysis (2018–2025)

Objective & Methodology

This analysis provides a comprehensive view of the Canadian secondary debt market, utilizing Python to engineer a robust ETL pipeline. The workflow normalizes disparate CIRO reporting structures and bilingual headers into a high-grain, "Single Source of Truth." A custom mapping schema was implemented to resolve the 2020 structural shift in maturity reporting, ensuring a consistent 7-year trend for long-term duration matching.

Key Strategic Insights

- **Structural Liquidity Migration:** The dashboard quantifies the June 2024 cessation of Bankers' Acceptances (BAs), tracking a significant liquidity migration into Repo markets and Treasury Bills as the market transitioned to CORRA benchmarks.
- **Duration Concentration:** Analysis identifies critical supply-side concentration in the 10Y+ "Long-End" of the curve, primarily driven by Provincial and Federal issuers—data vital for actuarial Asset-Liability Matching (ALM).
- **Counterparty Diversity:** The stable presence of Non-Resident participation (Foreign Capital) alongside domestic Institutional holders underscores the global depth and resilience of the Canadian sovereign debt market.

Value Proposition

This automated framework replaces manual aggregation with a scalable, audit-ready tool, enabling the RBC Investment Team to monitor market regimes, liquidity benchmarks, and duration risk with high precision.
